Introduction

To meet the increasing demand for superior full load and part load performance under varying condition and diverse application, Trane is proud to introduce model AdaptiR[™] with Adaptive Frequency[™] Drive(AFD) and variable volume ratio helical rotary liquid chiller. The introduction of this offering chiller is an exciting step of forward in enhancing energy-efficiency, operational cost-effectiveness, application versatility, ease of installation, control precision and reliability. The new chiller is designed to deliver proven Series R performance, plus the benefits of improved part load performance and reduced in-rush current associated with AFD.

AFD and variable volume ratio on screw compressors, being volume displacement type, operates well under part load at constant tower temperature or temp relief. And it is easy to do retrofit on current RTHD.

Important Design Advances and New Features

Major design advances include:

- High system IPLV and part load efficiency, with IPLV at most to 11.1, to reduce annual operating and lifecycle costs. Compared with fixed speed chiller designs, the AdaptiR[™] with AFD offers a part-load efficiency improvement of 17-39% while maintaining the same COP efficiency level. Compared with AdaptiR[™] with AFD models, the variable volume ratio chillers with D4 compressor offer a further partload efficiency improvement of ~20%.
- Optimized falling film evaporator bundle design, almost no carryover. More efficient oil seperator, the efficiency can reach to 99.98%. Robust thermosyphon oil return device make unit higher reliability. Electronic modulated valve make chiller always run above the reliable frequency, higher bearing reliability. Direct motor temperature monitor and protection logic, safer motor operation.
- Symbio800 controls and TD7 LCD touch screen display enable:
 - Providing better AFD speed adjustment control by embedded industry-leading control algorithms;
 - Simplifying chiller operation with the BACnet[™], ModBus[™] and LonTalk[™] capability without the need for gateways;
 - Scrolling access to inputs and operating information via the LCD touch-screen display which uses full text display available in 26 language;
 - Providing ease of interoperability with LonMark Communication;
- Job-specific communication options that allow greater reporting flexibility.
- AdaptiR[™] with AFD / variable volume ratio features low sound pressure level in part load. The
 reduced speed during part-load significantly reduces sound level. Optional sound wrap provides
 further sound attenuation. The quiet performance brings a comfortable environment to the chiller
 plant, making it a perfect choice for those noise sensitive installations such as libraries, schools,
 hospitals.
- The communicated Trane AFD for variable volume ratio chillers has more precise control and more information display.
- The Trane AFD is integrated with an AC-link reactor to minimize line harmonics to less than 40% total harmonic distortion(THDi); Low Harmonic filter is optional to meet IEEE 519 with input of AFD, reducing harmonic distortion to less than 5% THD, thus further reducing the impact on the grid. In addition, Trane AFD soft-start minimizes inrush current, thereby protecting other electrical or electronics devices sharing the same power grid.

The industrial-grade design of the AdaptiR[™] helical rotary chiller and its versatile operation capability make it an ideal choice for a wide spectrum of buildings. such as industrial plants, commercial/office buildings, hospitals, hotel and schools. The variable speed drive, linear unloading compressor, wide operating temperature range, advanced controls, electronic expansion valve, short anti-recycle timers, and industry-leading efficiencies make Trane AdaptiR[™] the preferred choice for applications requiring tight temperature control under varying load condition.

Features and Benefits

Application Versatility and High Performance

- Trane Adaptive Frequency™ drive a customized version of AFD series.
- Adaptive Frequency™ Drive ensures a quiet environment with the sound pressure level as low as to 72 dBA under most part-load condition.
- Screw compressor technology and the electronic expansion valve provide reliable performance in an expanded range of operating temperatures.
- Variable volume ratio technology application provide industry-leading part load efficiency.
- Tight water temperature control extends to operation of multiple chillers in parallel or series configurations, offering further system design flexibility for maximum efficiency.
- Advanced design enables chilled water temperature control to +/- 0.5°F (.28°C) for flow changes up to 10 percent per minute (flow changes up to 30 percent per minute for comfort cooling).
- Two-minute stop-to-start and five-minute start-to-start anti-recycle timer allows tight chilled water temperature control in constant or transient low-load applications.
- LonMark communications capability provides excellent, trouble-free interoperability.
- Generic Building Automation System points are available for easy access to operational information.
- Extensive information on professional design selection and layout is available in a simple, highly readable electronic format.

Simple, Economical Installation

- Compact size makes the AdaptiR[™] RTHD with AFD / variable volume ratio model well suited for the retrofit and replacement market.
- All units fit through standard double-width doors with disassemble of the panel.
- Integrated drive with advanced control panel to decrease field setup work.
- Bolt-together construction makes for fast, easy unit disassembly.
- Small footprint saves valuable equipment room space and alleviates access concerns for most retrofit jobs.
- Light weight design simplifies rigging requirements, further reducing installation time requirements and costs.
- Only evaporator and condenser water piping is required; no starter water cooling (with its associated safety concerns) or field piping is necessary.
- Simple power connection simplifies overall installation.
- Trane has conducted extensive factory testing, and also offers options for in-person and/or documented system performance verification.

State-of-the-Art, Precision Control

- The communicated drive for variable volume ratio models have more precise control and more information display.
- Microprocessor Symbio800 controls monitor and maintain optimal operation of the chiller and its associated sensors, actuators, relays, and switches, all of which are factory-assembled and extensively tested.
- Optional harmonic filtration system provides the harmonic solution to meet the requirements of IEEE 519 with input of AFD, reducing harmonic distortion to less than 5 percent total total harmonic distortion, which also provides filter over-temperature protection and capacitors disconnect.
- Adaptive Frequency™ Drive provides soft start to minimize inrush current and is integrated with AC line reactor to minimize line harmonics.
- Easy interface with computers hosting Tracer Summit[™] building automation/energy management systems allows the operator to efficiently optimize comfort system performance and minimize operating costs.

Features and Benefits

- PID (proportional integral derivative) control strategy ensures stable, efficient chilled water temperature control, maintaining +/-1°F (0.56°C) control by proactively reacting to instantaneous load changes of up to 50 percent.
- Adaptive Control[™] attempts to maintain chiller operation under adverse conditions, when many other chillers might simply shut down.
- Easy-to-use operator interface displays all operating and safety messages, with complete diagnostics information, on a highly readable panel with a scrolling touch-screen display.
- The AdaptiR[™] RTHD with AFD / variable volume ratio features a complete range of chiller safety controls.
- Over 120 diagnostic and operating points are available, with standard displays including chiller current draw, condenser pressure, and evaporator pressure.

Reliability and Ease of Maintenance

- Direct drive, low-speed compressor a simple design with only three moving parts provides maximum efficiency, high reliability, and low maintenance requirements.
- Electronic expansion valve, with fewer moving parts than alternative valve designs, offers highly reliable operation.
- Suction gas-cooled motor stays uniformly cool at lower temperature for longer motor life.
- The Trane helical rotary compressor is a proven design resulting from years of research and thousands of test hours, including extensive testing under extraordinarily severe operating conditions.
- Trane is the world's leading manufacturer of large helical rotary compressors, with tens of thousands of commercial and industrial installations worldwide demonstrating a reliability rate of greater than 99 percent in the first year of operation.

Operating and Life Cycle Cost-Effectiveness

- Electronic expansion valve enables exceptionally tight temperature control and extremely low superheat, resulting in more efficient full-load and part-load operation than previously available.
- Precise compressor rotor tip clearance ensures optimal efficiency.
- Variable volume ratio technology provide industry-leading part load efficiency.
- Condenser and evaporator tubes use the latest heat transfer technology for increased efficiency.
- The RTHD AFD includes optional electrical demand limiting.
- Chilled water reset based on return water temperature is standard.
- High compressor lift capabilities and tight chilled water temperature control allow highly efficient system design with minimal operational concerns.

Design capabilities include:

- Variable primary flow;
- Series chiller arrangements for evaporator and/or condenser;
- Low evaporator and condenser flow.

Options

Insulation

All low temperature surfaces are covered with factory installed 3/4 inch (19.05 mm) Armaflex II or equal (k=0.28) insulation, including the evaporator and water boxes, suction line, and motor housing. 3/8" foam insulation is used on the liquid level sensor and gas pump assembly, including piping.

Refrigerant Isolation Valves

Factory-installed condenser inlet and outlet refrigerant valves allow isolation of the full refrigerant charge in the condenser while servicing the chiller.

300 psig Evaporator and Condenser Water Boxes

Water boxes are designed for 300 psig maximum waterside working pressure, and flange connections are provided for ease of installation.

2-Way Condenser Water RegulatingValve

For water regulation, a field-installed, 2-way butterfly-type (lug-style) valve, with integral electrical operator and factory-mounted valve actuator, is available. The single-phase, reversible motor can be factory-wired for 220 VAC, 50 Hz; the 2-way valve is fieldwired and controlled by the chiller regulating valve control output; valves are available in 6" and 8" (152.4 and 203.2 mm) sizes.

Nitrogen Charge

Unit is shipped with a nitrogen holding charge in lieu of refrigerant.

Seal Kit for Reassembly

Ideal for situations when the bolttogether construction of the RTHD will be separated for installation, this seal kit provides replacement gaskets and rings for reassembly.

Under/Over-Voltage Protection

Unit receives protection against variations in voltage (current lag and spike protection is standard).

Performance and Witness Tests

AHRI-certified RTHD Performance and Witness Tests are available, based on requested operating points, to certify chiller performance before delivery.

Harmonic Filter

Harmonic filter provides the harmonic solution to meet the requirements of IEEE 519 with input of AFD, reducing harmonic distortion to less than 5 percent total harmonic distortion(THD).

Sound Wrap

Sound insulation material applied on discharge line is used to attenuate the tone of discharge pipe resonance and the total sound pressure level of unit.

Main Power Disconnect Options:

Standard Interrupting Capacity Circuit Breaker

A standard interrupting molded case capacity circuit breaker, factory pre-wired with terminal block power connections and equipped with a lockable external operator handle, is available to disconnect the chiller from main power.

Control Options:

Tracer Summit Communications

Link to factory-installed, tested communication board, via single twisted-pair wiring, adds Tracer Summit communications to the system.

LonTalk LCI-C Interface

LonTalk (LCI-C) communications capabilities are available, with communication link via single twisted pair wiring to factory-installed, tested communication board.

External Chilled Water Setpoint

External Chilled Water Setpoint is communicated to a factory-installed, tested communication board through a 2-10 V DC or 4-20 mA signal.

External Current Limiting

External Current Limit Setpoint is communicated to a factory-installed, tested communication board through a 2-10 V DC or 4-20 mA signal.

External Base Loading

External Base Loading is communicated to a factory-installed and tested communication board through a 2-10 V DC or 4-20 mA signal.

Chilled Water Reset - Outdoor Air Temperature

Controls, sensors, and safeties allow reset of chilled water temperature, based on temperature signal, during periods of low outdoor air temperature (chilled water reset based on return chilled water temperature is standard).

Condenser-Regulating Valve Control

Chiller applies a Proportional Integrative Control (PID) algorithm to control water regulating valve via 0-10 V DC signal.

Percent of Full Run Load Amps Output

Control system indicates the active chiller percent of full run load amps, based on a 0-10 V DC signal.

Condenser Pressure Output

Control system indicates chiller differential pressure or condenser pressure, based on a 0-10 V DC signal.

Controls

Tracer Symbio800 Controller

Today's chillers offer predictive controls that anticipate and compensate for load changes. Other control strategies made possible with theTracer Symbio800 controls are:

Feedforward Adaptive Control

Feedforward is an open-loop, predictive control strategy designed to anticipate and compensate for load changes. It uses evaporator entering-water temperature as an indication of load change. This allows the controller to respond faster and maintain stable leaving-water temperatures.

Soft Loading

The chiller controller uses soft loading except during manual operation. Large adjustments due to load or setpoint changes are made gradually, preventing the compressor from cycling unnecessarily. It does this by internally filtering the setpoints to avoid reaching the differential-to stop or the demand limit. Soft loading applies to the leaving chilled-water temperature and demand limit setpoints.

Adaptive Controls

There are many objectives that the controller must meet, but it cannot satisfy more than one objective at a time. Typically, the controllers primary objective is to maintain the evaporator leaving water temperature.

Whenever the controller senses that it can no longer meet its primary objective without triggering a protective shutdown, it focuses on the most critical secondary objective. When the secondary objective is no longer critical, the controller reverts to its primary objective.

Rapid Restart

The controller allows the chiller to perform a Rapid Restart. A Rapid Restart is performed after a momentary power loss occurs during operation. Similarly, if the chiller shuts down on a nonlatching diagnostic and the diagnostic later clears itself, a Rapid Restart will be initiated.

Adaptive Frequency Control

Compressor speed is used to control capacity of the chiller, optimizing compressor performance. The advanced Symbio800 Controller allows the chiller to operate at optimal efficiency, and with greater stability in capacity regulation.

Variable-Primary Flow (VPF)

Chilled-water systems that vary the water flow through chiller evaporators have caught the attention of engineers, contractors, building owners, and operators. Varying the water flow reduces the energy consumed by pumps, while having limited affect on the chiller energy consumption. This strategy can be a significant source of energy savings, depending on the application.

AdaptiViewTD7 Operator Interface

The standard AdaptiviewTMTD7 display provided with the Trane Symbio800 controller features a 7" LCD touch-screen, allowing access to all operational inputs and outputs. This is an advanced interface that allows the user to access any important information concerning setpoints, active temperatures, modes, electrical data, pressure, and diagnostics. It uses full text display available in 26 languages.

Display Features Include:

- LCD touch-screen with LED backlighting, for scrolling access to input and output operating information
- Single-screen, folder/tab-style display of all available information on individual components (evaporator, condenser, compressor, etc.)
- Manual override indication
- Password entry/lockout system to enable or disable display
- Automatic and immediate stop capabilities for standard or immediate manual shutdown
- Fast, easy access to available chiller data in tabbed format, including:
- Easy to view Operating Modes
- Logical Sub-Component Reports:
 - Evaporator
 - Condenser
 - Compressor
- Motor
- 3 User Programmable Custom Reports
- ASHRAE report
- Logsheet Report
- Alarms Report
- 8 pre-defined Standard Graphs
- 4 User Programmable Custom Graphs
- Chiller Settings
- Feature Settings
- Chilled Water Reset
- Manual Control Settings
- Globalization Settings
- Support of 26 languages
- Brightness Setting
- Cleaning Mode

TracerTU Interface

TracerTU (utility software) adds a level of sophistication that improves service technician effectiveness and minimizes chiller downtime. The Tracer AdaptiView control's operator interface is intended to serve only typical daily tasks. The portable PC-based service-tool software, TracerTU, supports service and maintenance tasks. TracerTU serves as a common interface to all Trane® chillers, and will customize itself based on the properties of the chiller with which it is communicating. Thus, the service technician learns only one service interface.

The panel bus is easy to troubleshoot using LED sensor verification. Only the defective device is replaced. TracerTU can communicate with individual devices or groups of devices.

All chiller status, machine configuration settings, customizable limits, and up to 100 active or historic diagnostics are displayed through the service-tool software interface.

LEDs and their respectiveTracerTU indicators visually confirm the availability of each connected sensor, relay, and actuator.

TracerTU is designed to run on a customer's laptop, connected to the Tracer AdaptiView control panel with a USB cable. Your laptop must meet the following hardware and software requirements:

- 1 GB RAM (minimum)
- 1024 x 768 screen resolution
- CD-ROM drive
- Ethernet 10/100 LAN card
- An available USB 2.0 port
- Microsoft® Windows® XP Professional operation system with Service Pack 3 (SP3) or Windows 7 Enterprise or Professional operating system (32-bit or 64-bit)
- Microsoft . NET Framework 4.0 or later

Note: TracerTU is designed and validated for this minimum laptop configuration. Any variation from this configuration may have different results. Therefore, support forTracerTU is limited to only those laptops with the configuration previously specified.

System Integration

Stand-Alone Controls

Single chillers installed in applications without a building management system are simple to install and control: only a remote auto/stop for scheduling is required for unit operation. Signals from the chilled-water pump contactor auxiliary, or a flow switch, are wired to the chilled-water flow interlock. Signals from a time clock or some other remote device are wired to the external auto/ stop input.

- Auto/Stop-A job-site provided contact closure turns the unit on and off.
- Emergency Stop-Ajob-site provided contact opening wired to this input turns the unit off and requires a manual reset of the unit microcomputer. This closure is typically triggered by a job-site provided system such as a fire a larm.

Hardwire Points

Microcomputer controls allow simple interface with other control systems, such as time clocks, building automation systems. This means you have the flexibility to meet job requirements while not having to learn a complicated control system.

Remote devices are wired from the control panel to provide auxiliary control to a building automation system. Inputs and outputs can be communicated via a typical 4–20 mA electrical signal, an equivalent 2–10 V DC signal, or by utilizing contact closures.

This setup has the same features as a stand-alone water chiller, with the possibility of having additional optional features:

- External chilled water setpoint, external demand limit setpoint
- Chilled water temperature reset
- Programmable relays available outputs are: alarm-latching, alarm-auto reset, general alarm, warning, chiller limit mode, compressor running, and Tracer control.

BACnet Interface

Tracer AdaptiView control can be configured for BACnet communications at the factory or in the field. This enables the chiller controller to communicate on a BACnet MS/TP network. Chiller setpoints, operating modes, alarms, and status can be monitored and controlled through BACnet.

Tracer AdaptiView controls conform to the BACnet B-ASC profile as defined by ASHRAE 135-2004.

LonTalk Communications Interface (LCI-C)

The optional LonTalk® Communications Interface for Chillers (LCI-C) is available factory or field installed. It is an integrated communication board that enables the chiller controller to communicate over a LonTalk network. The LCI-C is capable of controlling and monitoring chiller setpoints, operating modes, alarms, and status. TheTrane LCI-C provides additional points beyond the standard LONMARK® defined chiller profile to extend interoperability and support a broader range of system applications. These added points are referred to as open extensions. The LCI-C is certified to the LONMARK Chiller Controller Functional Profile 8040 version 1.0, and follows LonTalk FTT-10A free topology communications.

Modbus Interface

Tracer AdaptiView control can be configured for Modbus communications at the factory or in the field. This enables the chiller controller to communicate as a slave device on a Modbus network.

Chiller setpoints, operating modes, alarms, and status can be monitored and controlled by a Modbus master device.

Controls

Tracer Summit

The chiller plant control capabilities of the Trane Tracer Summit[™] building automation system are unequaled in the industry. Trane's depth of experience in chillers and controls makes us a wellqualified choice for automation of chiller plants using chillers. Our chiller plant automation software is fully pre-engineered and tested.

Required features:

- LonTalk/Tracer Summit Interface (selectable option with chiller)
- Building Control Unit (external device required)
- Energy Efficiency
 - Sequences starting of chillers to optimize the overall chiller plant energy efficiency
 - Individual chillers operate as base, peak, or swing based on capacity and efficiency - Automatically rotates individual chiller operation to equalize runtime and wear between
 - chillers.
 - Evaluates and selects the lowest energy consumption alternative from an overall system perspective.

Regulatory Compliance Documentation

- Gathers information and generates the reports mandated in ASHRAE Guideline 3.
- Easy Operation and Maintenance
 - Remote monitoring and control
 - Displays both current operation conditions and scheduled automated control actions
- Concise reports assist in planning for preventative maintenance and verifying performance
- Alarm notification and diagnostic messages aid in quick and accurate troubleshooting

Tracer SC

The Tracer SC[™] system controller acts as the central coordinator for all individual equipment devices on a Tracer building automation system. The Tracer SC scans all unit controllers to update information and coordinate building control, including building subsystems such as VAV and chiller water systems. With this system option, the full breadth of Trane's HVAC and controls experience are applied to offer solutions to many facility issues. The LAN allows building operators to manage these varied components as one system from any personal computer with web access. The benefits of this system are:

- Improved usability with automatic data collection, enhanced data logging, easier to create graphics, simpler navigation, pre-program medsche duling, reporting, and alarmlogs.
- Flexibletech nology allows for system sizes from 30-120 unit controllers with any combination of Lon Talk or BACnet unit controllers.
- LEED certification through site commissioning report, energy data collection measurement, optimizing energy performance, and maintaining indoor air quality.

Energy savings programs includes chiller plant control (adds and subtracts chillers to meet cooling loads).

Building Automation and Chiller Plant Control

The Symbio800 controller can communicate with Trane Tracer Summit, and Tracer SC building automation systems, which include pre-engineered and flexible control for chiller plants.

These building automation systems can control the operation of the complete installation: chillers, pumps, isolating valves, air handlers, and terminal units. Trane can undertake full responsibility for optimized automation and energy management for the entire chiller plant. The main functions are:

- Chiller sequencing: equalizes the number of running hours of the chillers. Different control strategies are available depending on the configuration of the installation.
- Control of the auxiliaries: includes input/output modules to control the operation of the various auxiliary equipment (water pumps, valves, etc.)
- Time-of-day scheduling: allows the end user to define the occupancy period, for example: time of the day, holiday periods and exception schedules.
- Optimization of the installation start/stop time: based on the programmed schedule of occupancy and the historical temperature records. Tracer Summit andTracer SC calculate the optimal start/stop time of the installation to get the best compromise between energy savings and comfort of the occupants.
- Soft loading: the soft loading function minimizes the number of chillers that are operated to satisfy a large chilled-water-loop pull down, thus preventing an overshoot of the actual capacity required. Unnecessary starts are avoided and the peak current demand is lowered.
- Communication capabilities: local, through a PC workstation keyboard. Tracer Summit and Tracer SC can be programmed to send messages to other local or remote workstations and or a pager in the following cases:
 - Analog parameter exceeding a programmed value
 - Maintenance warning
 - Component failure alarm
 - Critical alarm messages. In this latter case, the message is displayed until the operator acknowledges the receipt of the information. From the remote station it is also possible to access and modify the chiller plants control parameters.
- Remote communication through a modem: as an option, a modem can be connected to communicate the plant operation parameters through voice grade phone lines.

A remote terminal is a PC workstation equipped with a modem and software to display the remote plant parameters.

Integrated Comfort System (ICS)

The on board Tracer chiller controller is designed to be able to communicate with a wide range of building automation systems. In order to take full advantage of chiller's capabilities, incorporate your chiller into a Tracer Summit or Tracer SC building automation system.

But the benefits do not stop at the chiller plant. At Trane, we realize that all the energy used in your cooling system is important. That is why we worked closely with other equipment manufacturers to predict the energy required by the entire system. We used this information to create patented control logic for optimizing HVAC system efficiency.

The building owners challenge is to tie components and applications expertise into a single reliable system that provides maximum comfort, control, and efficiency. Trane Integrated Comfort systems (ICS) are a concept that combines system components, controls, and engineering applications expertise into a single, logical, and efficient system. These advanced controls are fully commissioned and available on every piece of Trane[®] equipment, from the largest chiller to the smallest VAV box. As a manufacturer, onlyTrane offers this universe of equipment, controls, and factory installation and verification.

Application Considerations

Condenser Water Temperatures

Reduced sensitivity to condenser water startup temperatures is one major enhancement in the newest-generation water-cooled Series R chiller. With the model RTHD AFD chiller, a condenser water control method is necessary only if the unit starts with entering water temperatures below 55°F (12.8°C), or between 45°F (7.2°C) and 55°F (12.8°C), when a temperature increase of 1°F (0.56°C) per minute to 55°F (12.8°) is not possible.

When the application requires startup temperatures below the prescribed minimums, a variety of options are available. To control a 2-way or 3-way valve, Trane offers a Condenser Regulating Valve Control option for the Symbio800 controls. This option enables the Symbio800 controls to send a signal for opening and closing the valve as necessary to maintain chiller differential pressure. The 2-way valves are available as a ship-with option. Tower bypass is also a valid control method if the chiller temperature requirements can be maintained.

Trane Series R chillers start and operate successfully and reliably over a range of load conditions with controlled entering condenser water temperature. Reducing the condenser water temperature is an effective method of lowering chiller power input required, but the ideal temperature for optimizing total system power consumption will depend on the overall system dynamics. From a system perspective, some improvements in chiller efficiency may be offset by the increased tower fan and pumping costs required to achieve the lower tower temperatures. Contact your local Trane systems solution provider for more information on optimizing system performance.

The minimum acceptable refrigerant pressure differential between condenser and evaporator is 23 psid. The chiller control system will attempt to obtain and maintain this differential at startup, but for continuous operation a design should maintain a 25°F (13.9°C) differential from evaporator leaving water temperature to condenser leaving water temperature.

Variable Evaporator Flow and Short Evaporator Water Loops

Variable evaporator flow is an energysaving design strategy which has quickly gained acceptance as advances in chiller and controls technology have made it possible. With its linear unloading compressor design and advanced Symbio800 controls, the AdaptiR[™] RTHD with AFD has excellent capability to maintain leaving water temperature control within +/-0.5°F (0.28°C), even for systems with variable evaporator flow and small chilled water volumes.

Some basic rules should be followed whenever using these system design and operational savings methods with the AdaptiR[™] RTHD with AFD. The proper location of the chilled water temperature control sensor is in the supply (outlet) water. This location allows the building to act as a buffer, and it assures a slowly changing return water temperature. If there is insufficient water volume in the system to provide an adequate buffer, temperature control can be lost, resulting in erratic system operation and excessive compressor cycling. To ensure consistent operation and tight temperature control, the chilled water loop should be at least two minutes. If this recommendation cannot be followed, and tight leaving water temperature control is necessary, a storage tank or larger header pipe should be installed to increase the volume of water in the system.

For variable primary flow applications, the rate of chilled water flow change should not exceed 10 percent of design per minute to maintain +/-0.5°F (0.28°C) leaving evaporator temperature control. For applications in which system energy savings is most important and tight temperature control is classified as +/-2°F (1.1°C), up to 30 percent changes in flow per minute are possible. Flow rates should be maintained between the minimum and maximum allowed for any particular chiller configuration.

Series Chiller Arrangements

Another energy-saving strategy is to design the system around chillers arranged in series, on the evaporator, condenser, or both. The actual savings possible with such strategies depends on the application dynamics and should be researched by consulting your Trane Systems Solutions Representative and applying the Trane System Analyzer program. It is possible to operate a pair of chillers more efficiently in a series chiller arrangement than in a parallel arrangement. It is also possible to achieve higher entering-to-leaving chiller differentials, which may, in turn, provide the opportunity for lower chilled water design temperature, lower design flow, and resulting installation and operational cost savings. The Trane screw compressor also has excellent capabilities for "lift", which affords an opportunity for savings on the evaporator and condenser water loops. Like series arrangements on the evaporator, series arrangements on the condenser may enable savings. This approach may allow reductions in pump and tower installation and operating costs.

Maximizing system efficiency requires that the designer balance performance considerations for all system components; the best approach may or may not involve multiple chillers, or series arrangement of the evaporators and/or condensers. This ideal balance of design integrity with installation and operating cost considerations can also be obtained by consulting a Trane representative and applying the Trane System Analyzer program.

Water Treatment

The use of untreated or improperly treated water in chillers may result in scaling, erosion, corrosion, and algae or slime buildup. It is recommended that the services of a qualified water treatment specialist be engaged to determine what treatment, if any, is advisable. Trane assumes no responsibility for the results of using untreated or improperly treated water.

Water Pumps

Where noise limitation and vibrationfree operation are important, Trane strongly encourages the use of 1750-rpm (60 Hz), 1450-rpm (50 Hz) pumps. Specifying or using 3600-rpm (60 Hz), 3000-rpm (50 Hz) condenser water and chilled water pumps must be avoided, because such pumps may operate with objectionable levels of noise and vibration. In addition, a low frequency beat may occur due to the slight difference in operating rpm between 3600-rpm (60 Hz), 3000-rpm (50 Hz) water pumps and Series R chiller motors. Important Note: The chilled water pump must not be used to stop the chiller.

Acoustic Considerations

For chiller sound ratings, installation tips, and considerations on chiller location, pipe isolation, etc., refer to the Trane Water-Cooled Series R Chillers Sound Ratings and Installation Guide. Using the information provided in this bulletin, contact a certified sound consultant to aid in proper mechanical room design and treatment.

Selection Procedure

Trane AdaptiR[™] chiller performance is rated in accordance with the AHRI Standard 550/590-2011 Certification Program. Chiller selection assistance and performance information can be obtained by using the Series R chiller selection program, available through local Trane sales offices.

Performance

The computerized AdaptiR[™] chiller selection program provides performance data for each possible chiller selection at both full-load and part-load design points, as required. It should be noted that changing the number of water passes or the water flow rates will generally alter the performance of a particular chiller. To attain maximum benefit from the wide range of chiller models and options available, designers are encouraged to first develop performance specifications and then use the chiller selection program to optimize all selections. This will help ensure selection of the compressor evaporator - condenser combination that most closely meets the job requirements. To optimize system performance, all selections should also be balanced with other system components.

Fouling Factors

AHRI Standard 550 includes a definition of clean tube fouling. The recommended standard fouling adjustments are 0.0001 hr-sq ft-deg F/Btu (0.0176 sq m-deg C/kW) for the evaporator and 0.00025 hr-sq ft deg F/Btu (0.044 sq m-deg C/kW) for the condenser, from an increment of 0.0000 "clean." Chiller specifications should be developed using the most current standard fouling factors.

Part Load Performance

Actual air-conditioning system loads are frequently less than full-load design conditions. Depending on the number of chillers on the job and the load profile, chillers may operate at full load a small percentage of the time. With their excellent part-load performance characteristics and highly energyefficient operation, AdaptiR[™] chillers can provide significant operating savings at these partload conditions, maximum down to 20%.

System Considerations

Part-load chiller operation is frequently associated with reduced condenser water temperatures. However, rather than focusing only on the chiller, it is important to balance these temperatures to achieve the most efficient system operation possible. At part-load operation, the heat rejected to the cooling tower is less than at fullload operation.

Part-load chiller operation is also typically associated with reduced outside wet bulb temperatures, resulting in improved cooling tower performance. The net result of reduced heat rejection and lower wet bulb temperatures can be cooler condenser water entering the chiller, ultimately improving unit performance. However, this does not improve pump or tower efficiency. To achieve the most efficient system operation possible, it is best to minimize the total power draw of the chiller, tower, and pumps, which may not mean limiting the condenser water temperature to what the tower can provide. To determine specific unit and system part-load performance for chiller selection purposes, use the Series R chiller computer selection program or contact the local Trane sales office.

Evaporator and Condenser Pressure Drop

Pressure drop data is determined by the AdaptiR[™] chiller computer selection program available through local Trane sales offices.

Dimensional Drawings

Dimensional drawings provided for selection purposes illustrate overall measurements of the unit. The recommended service clearances are those required to easily service the AdaptiR[™] chiller. All catalog dimensional drawings are subject to change, and current submittal drawings should be referenced for more detailed dimensional information. Dimensional drawings are also available from the selection program. Contact the local Trane sales office for submittal information.

Electrical Data Tables

Compressor motor electrical data is provided in the data section for each compressor size. Rated load amperes (RLA), locked rotor wye amperes (LRA) and expected inrush for AFD configurations are shown.

The RLA is based on the motor's performance when reaching full rated horsepower. The kW rating of the motor will equal or exceed the kW requirement indicated by the AdaptiR[™] computer selection program at design conditions. If motor kW draw at design conditions is less than the kW rating of the motor, the RLA at design conditions is determined by multiplying the motor RLA (at the desired voltage) by this ratio: design kW/motor kW rating. This calculation is performed within the Series R chiller computer selection program, making RLA available as part of the design predictions. Predicted values include power factor variation from point to point.

A voltage utilization range is tabulated for each voltage listed. AdaptiR[™] chillers are designed to operate satisfactorily over a utilization range of ±10 percent of the standard design voltages: 380 V, 415 V for 50 Hertz, 380 V/60 Hz, 460 V/60 Hz, 3-phase.

Mechanical Specifications

General

Exposed metal surfaces are painted with air-dry beige, direct-to-metal, single-component paint. Each unit ships with full operating charges of refrigerant and oil. Molded neoprene isolation pads are supplied for placement under all support points. Startup and operator instruction by factorytrained service personnel are included.

Adaptive Frequency[™] Drive(AFD)

Trane Adaptive Frequency[™] Drive(AFD)- customized version of AFD series -Trane TL380, is an air cooled and unit mounted drive and be integrated in the starter panel. It has 2 frames, 13 models, which could be applied 380V/400V/415V in 50Hz and 380V/60Hz, 460V/60Hz. It is integrated AC line reactor minimize line harmonics to less than 40% total harmonic distortion(THDi). Optional low harmonic filter provides the harmonic solution to meet the requirement of IEEE 519 with input of AFD, reducing harmonic distortion to less than 5% THD.

Trane Communicated Drive- RTHD VVi series-Trane TL330, is an air cooled and unit mounted drive and integrated in the starter panel. It has 2 frames, 7 models, which could be applied on 380V/400V/415V at 50Hz and 380V/60Hz, 460V/60Hz. It is integrated with AC line reactor to minimize line harmonics to less than 40% total harmonic distortion(THDi). Harmonic filter option provides low harmonic solution to meet the requirement of IEEE 519 with input of AFD, reducing harmonic distortion to less than 5% THD.

Compressor and Motor

The unit is equipped with a semihermetic, direct-drive, 1500-3600rpm (3000rpm @ 50 Hz) rotary compressor that includes a capacity control slide valve, oil sump heater, and differential pressure refrigerant oil flow system. Four pressure-lubricated, rollingelement bearing groups support the rotating assembly. The motor is a suction gas-cooled, hermetically sealed, two-pole, squirrel cage induction-type.

Evaporator and Condenser

Shells are carbon steel plate. The evaporator and condenser are designed, tested, and stamped in accordance with ASME Code for refrigerant-side/ working-side pressure of 200 psig. All tube sheets are made of carbon steel; tubes are mechanically expanded into tube sheets and mechanically fastened to tube supports. Evaporator tubes are 1.0-inch (25.4 mm) diameter and condenser tubes are 0.75-inch (19.05 mm) diameter. Both types can be individually replaced. Standard tubes are externally finned, internally enhanced seamless copper with lands at all tube sheets.

All water pass arrangements are available with flange connections (150 or 300 psig waterside). All connections may be either right- or left-handed. Waterside shall be hydrostatically tested at 1.5X design working pressure.

Refrigerant Circuit

An electronically controlled expansion valve is provided to maintain proper refrigerant flow.

Unit Controls (Symbio800)

The microprocessor-based control panel is factory-installed and factory tested. The control system is powered by a control power transformer, and will load and unload the chiller through AFD modulation of compressor speed and in combination with slide valve at low load. Microprocessor-based chilled water reset based on return water is standard.

The Symbio800 microprocessor automatically acts to prevent unit shutdown due to abnormal operating conditions associated with low evaporator refrigerant temperature, high condensing temperature, and/or motor current overload. If an abnormal operating condition continues and the protective limit is reached, the machine should shut down.

The panel includes machine protection shutdown requiring manual reset for the following

conditions:

- low evaporator refrigerant temperature and pressure
- high condenser refrigerant pressure
- low oil flow
- critical sensor or detection circuit faults
- motor current overload
- high compressor discharge temperature
- lost communication between modules
- electrical distribution faults: phase loss, phase imbalance, or phase reversal
- external and local emergency stop
- starter transition failure

The panel also includes machine protection shutdown with automatic reset for the following correctable conditions:

- momentary power loss
- under/over voltage
- · loss of evaporator or condenser water flow
- high motor winding temperature
- comm loss: adaptive frequency drive
- excessive condenser pressure

When a fault is detected, the control system conducts more than 100 diagnostic checks and displays results. The display will identify the fault, indicate date, time, and operating mode at time of occurrence, and provide type of reset required and a help message. The diagnostic history will display the last ten diagnostics with their times and dates of occurrence.

Clear Language Display Panel

Factory-mounted to the control panel door, the operator interface has an LCD touch-screen display for operator input and information output. This interface provides access to the following information: evaporator report, condenser report, compressor report, ASHRAE Guideline 3 report, operator settings, service settings, service tests, and diagnostics. All diagnostics and messages are displayed in "clear language."

Data contained in available reports includes:

- Water and air temperatures
- Refrigerant levels and temperatures
- Oil pressure
- Flow switch status
- EXV position
- Head pressure control command
- Compressor starts and run-time
- Line phase percent RLA, amps, and volts
- Motor winding temperatures
- Compressor Vi state command

All necessary settings and setpoints are programmed into the microprocessorbased controller via the operator interface. The controller is capable of receiving signals contemporaneously from a variety of control sources, in any combination, and priority order of control sources can be programmed.

The control source with priority determines active setpoints via the signal it sends to the control panel.

Control sources may be:

- the local operator interface (standard)
- a hard-wired 4-20 mA or 2-10 V DC signal from an external source (interface optional; control source not supplied)
- Generic BAS (optional points; control source not supplied)
- LonTalk LCI-C (interface optional; control source not supplied)
- Trane Tracer Summit[™] system (interface optional)

Trane - by Trane Technologies (NYSE:TT), a global climate innovator - creates comfortable, energy efficient indoor environments for commercial and residential applications. For more information, please visit trane.com or tranetechnologies.com.

Trane has a policy of continuous product and product data improvement and reserves the right to change design and specifications without notice. We are committed to using environmentally conscious print practices.
